

Veterinary

Like the pharmaceutical industry the veterinary sector is heavily regulated. Furthermore the final product is likely to be part of the human food chain. These features mean control, quality and the regulatory system are vitally important.

Inorganic salts are essential in the development of veterinary products. Their quality is critical to ensure the excellence of the final products.

We can partner the development of specific products, whether excipients or active ingredients, monitor and document traceability and meet the pharmacopoeia and required standards.

These products will be manufactured in the future in line with GMP standards.
